

SAFE RELEASE SYSTEM™ ** - standard on the 'Classic' version

The Safe Release System™ - European patent - allows the handler to easily release the horse from the trailer, single handed without hazard from kicking and with control from the front of the horse.

After loading the webbing strap can easily be clipped into place quickly securing the horse within the trailer, before fitment of the rear breech bar and closure of the rear door.

FAUTRAS TECH™ PARTITION on 2 horse models only

The concept of rigid partition deprives the horse of the space they need to stabilize during transportation, in a confined situation many horses will panic, scabble, lean or even go down.

The **FAUTRAS TECH™** flexible partition gives the horse an improved sense of space encouraging the horse to balance naturally and discourages the horse from leaning, especially when traveling forwards around corners and roundabouts.

IMMEDIATE SECURITY™ BREAST BAR *

This Immediate Security™ breast bar - European patent is designed to resist pressure applied horizontally which may be typical from a horse leaning forwards, however it will release when vertical pressure (150kg or more) is applied, typical of a horse climbing over the bar. In this circumstance the bar will be released instantly without human intervention thus avoiding panic in the horse and risk of injury to the handler.

Once broken the release pin can be replaced so and the bar is reusable.

FAUTRAS® EQUINE FRIENDLY ENTRANCE

By increasing the distance between the horse and trailer, traditional entrance with a ramp makes loading less inviting for the horse. Moreover, the edges of a ramp make it easy for the horse to slip and injure themselves when unloading.

The Fautras® equine friendly entrance is an American style step in entrance (2 doors and no ramp) associated to a Progressive Floor™ - European patent – standard on all the Forwards transportation range.

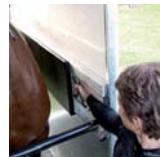

FAUTRAS AID SYSTEM® ***

Loading horses is always difficult when you are alone. Indeed, tying a horse before the rear bar is in position or releasing the horse to be able to put this bar are both risky operations. In addition, the action of position the bar make it difficult to avoid injury should a horses kick out.

The AID System® - European patent - is a unique system which enables a person to load and unload their horses safely.

The back shutter (operated from the front of the trailer) opens and closes with direct contact from the handler, so all operations are done with the handler remaining at the front of the horses. This innovation has earned Fautras to receive a double Innovation Trophy at the Salon du Cheval de Paris 2007: Jury Prize and Audience Award.

THE INNOVATIONS

Forwards transportation

Why choose the Fautras® equine friendly entrance ?

«It allows the horse to move forward into the trailer without the obstacle of the ramp. Worldwide experience has shown benefits of this system especially for the nervous, young or unconfident horses.»

Jean Luc Fautras
